

Distance learning at coronavirus

The pandemic that hit the planet continues to sow panic. Almost all over the world it was decided to transfer schoolchildren to remote study, on the turn of universities. And it is difficult to overestimate such measures to prevent the virus spreading. Distance learning at coronavirus is the safest format among all existing ones.

What does it mean, remote education and how does it pass?

The essence of remote learning is the lack of direct contact and mass crowds of people in lecture rooms, which is useful when COVID-19 is being promoted around the world in seven steps. Students from any region can study this way at any university.

Classes .

The organization of processes comes down to the following:

- students are registered on the platform of the university;
- in their personal cabinet they receive materials for training - schedules, textbooks, links to websites, methods;
- classes can be held live, when students are going to a lecture or seminar, not offline, but online (there is no difference between regular studies and remote ones);
- communication with teachers is carried out online, by e-mail, and by phone.

What are the advantages of remote study?

In coronavirus conditions, everyone benefits from the transition to a remote form. When students need to write a research paper, they can always use the research paper writing service without having to worry that it might be noticed by the teacher. Students take the course without reducing the intensity. The diploma does not specify the form of training - it is quoted in the same way as a document of full-time graduates.
